Abstract: *Chlamydomonas reinhardtii* is a unicellular green alga that has been used as a model organism for studying photosynthesis, cell division, and other cellular processes. This paper describes the growth of *C. reinhardtii* in a continuous culture system, where the cells are maintained in a constant state of division. The growth rate is determined by the rate of cell division, which is influenced by various factors such as light intensity, nutrient availability, and temperature. The continuous culture system allows for the study of the effects of these factors on the growth and division of the cells over a long period of time.
